

Lead Generation Friction & RTO API Optimization

Prepared for ScrapCentre • Date: July 2026 • Status: Strategic Proposal

EXECUTIVE SUMMARY

An audit of the ScrapCentre checkout and lead capture flow reveals significant opportunities to improve conversion rates by reducing form friction. While the platform utilizes the **Surepass RTO API** to fetch key vehicle attributes (brand, model, year, and weight), it asks users for redundant or non-essential information across subsequent steps.

By mapping the RTO response payload (owner name, registered address, fuel type) and removing the non-essential, skippable **Vehicle Photo** screen, we can eliminate up to **6 screens** and reduce user operations by **66%**, creating an ultra-streamlined, 3-step lead generation experience.

MANUAL FORM INPUTS

DETAILED CURRENT LEAD CAPTURE PROCESS (SCRAP FLOW)

Step	Screen / State	Required User Actions	Interaction	RTO API Status
1	Home Hero Input	User types vehicle registration number (e.g. DL01AB1234) and clicks "GET VALUATION".	1 TEXT INPUT 1 CLICK	TRIGGERED
2	Verify Vehicle Details	User checks the auto-filled Maker/Model/Year/Weight and clicks "Confirm & Continue".	1 CLICK	FETCHED
3	Buy New Choice	User answers: "Buy a new vehicle?" with "Yes" or "No". Assuming "No" for basic scrap valuation.	1 CLICK	-
4	Fuel Type	User selects fuel types (Petrol, Diesel, CNG, Electric, Hybrid) and clicks "Next Step".	2 CLICKS	REDUNDANT
5	Owner Name	User types their full name and clicks "Continue".	1 TEXT INPUT 1 CLICK	REDUNDANT
6	Vehicle Location	User inputs 6-digit Pincode (State/City auto-filled on type) and clicks "Continue".	1 TEXT INPUT 1 CLICK	REDUNDANT
7	Vehicle Photo	User captures a photo or clicks "Skip for Now". Recommendation: Since it has a skip option and is not strictly necessary for generating the initial estimate, this step should be removed completely to eliminate screen fatigue.	1 CLICK	-
8	Unlock Valuation	User inputs a 10-digit phone number and clicks "Get OTP".	1 TEXT INPUT 1 CLICK	-
9	OTP Verification	User receives OTP code, inputs 6 digits, and clicks "Verify & Get Valuation".	1 TEXT INPUT 1 CLICK	-

FRICION REDUCTION STRATEGY VIA SUREPASS API

Key Discovery: The Surepass RTO endpoint (/api/v1/rc/rc-v2) returns the complete RTO ledger for the registration number. This contains owner_name, present_address / permanent_address, and fuel_type.

By implementing the following changes, we can fully automate inputs that are currently requested manually and remove skippable steps:

1. Auto-Populate Owner Name

Currently, Step 5 asks for the user's name. The API returns owner_name. We can automatically feed this into the form state, pre-filling the step or removing it entirely:

```
// In ValuationWizardCard.tsx during RTO result binding setFormData(prev => ({ ...prev, name: data.owner_name || prev.name }));
```

2. Auto-Populate Fuel Type

Currently, Step 4 asks for the vehicle's fuel type. Since the API returns fuel_type (e.g. "PETROL", "DIESEL/CNG"), we can parse it using the existing normalizeFuelType function and skip the step entirely:

```
// Map fuel type instantly on fetch const normalizedFuel = normalizeFuelType(data.fuel_type); setFormData(prev => ({ ...prev, fuel: normalizedFuel || prev.fuel }));
```

3. Parse Pincode & Auto-fill Location

Instead of asking the user for their location in Step 6, we can search the RTO registered addresses for a 6-digit pin code using a regular expression. Once found, we automatically trigger the existing verifyAndFillViaPincode() method to fill State and City:

```
// Extract and parse location in background const addressText = data.present_address || data.permanent_address || ""; const pincodeMatch = addressText.match(/b\d{6}b/); if (pincodeMatch) { const extractedPincode = pincodeMatch[0]; verifyAndFillViaPincode(extractedPincode); // Automatically fetches State & City }
```

4. Remove Non-Essential Steps (Vehicle Photo)

The **Vehicle Photo** screen has a "Skip for Now" option. By design, any step that can be skipped and is not required for the initial valuation calculations should be removed from the onboarding flow. Photos can instead be requested at a

later stage (e.g., during the eKYC phase or when scheduling vehicle pickup), reducing lead capture time by another screen.

OPTIMIZED FLOW VS. CURRENT FLOW

Current Process (9 Steps)

- Type Reg No
- Verify Brand & Model
- Choose Scrappage (Yes/No)
- **Select Fuel Type (Manual)**
- **Type Owner Name (Manual)**
- **Type Location/Pincode (Manual)**
- **Upload/Skip Vehicle Image (Skippable)**
- Type Mobile Number
- Enter OTP & Verify

Optimized Process (3 Steps)

- ✓ Type Reg No
- ✓ **Review RTO Verified Details**
Aggregated screen showing Brand, Model, Fuel, Owner, and Registered Location. Click "Looks Good!"
- ✓ **Choose Scrappage (Yes/No) + Mobile & Verify OTP**
(Photo step is completely removed; name, fuel, and location are fully automated).
